## GO (general oscillogram)

Module for the acquisition and precise recording of various signal distortions and transient events. This module will record oscillograms of voltages and currents with extended details (up to 288 samples per period) and trigger options in high resolution in the memory. The data stored here can be processed in ENVIS or exported to .xls or .csv files for processing in any third-party application. ENVIS not only permits calculation of the

RMS value of current and voltage, but also that of harmonics, THDs, and other values. Averaging of the calculated data can be configured starting at a single period.

Designation	Description	Availability	Order no.
GO	Oscilloscope function	See technical specifications	53.21.1340
